# Flower boxes and Planters

## VB-EPDM membranes for lining flower boxes and planters.

**VB-EPDM** sheeting is excellent for the lasting sealing of flower boxes and planters. Leaking flower boxes and planters can easily be repaired with VB-EPDM sheeting. Prefabricated VB-EPDM liners can also be used as self-contained flower boxes and planters. Placed in the ground between the paving, the VB-EPDM sheeting ensures that plant and flower roots are held back.

**VB-EPDM** prefab planters are available in almost any shape and size. They are easy to install in existing planters, but they can also be used as self-contained planters in green areas. VB-EPDM sheeting is resistant to root penetration in accordance with FLL guidelines. However, it cannot hold back some roots, for example the roots of certain bamboo and reed-like plants, for which alternative arrangements must be made. VB-EPDM sheeting is UV-resistant and does not leach out.

**VB-EPDM membranes** consist of rubber sheeting of the highest European quality. They are created by the bespoke vulcanisation of strips of EPDM sheet and come in a selection of thicknesses. This results in seamless and homogenous VB-EPDM membranes that precisely meet the standards set. Each membrane comes with a corresponding certificate and installation instructions. VB-EPDM rubber has a very favourable environmental impact factor and it is ecologically sound. The environmental effects during its whole life cycle are extremely low.

**Van Beek EPDM BV** has been supplying bespoke solutions in EPDM rubber since 1972 and is more familiar with the stringent demands placed on long-lasting seals than any other manufacturer.
